

Improving the delivery of Wireline Networks through an efficient digital process

When expanding the build out of your fiber, conduit or other wireline infrastructure, finding the optimal route to minimize cost and maximize your time to market is a complex and critical step in building a resilient network. There is a lack of readily available data on suitable locations coupled with a lengthy process to connect with other infrastructure owners with available capacity, which presents a significant barrier to deploying the wireline networks needed to connect people and power our economies.

Asset Market is an online digital platform that helps to identify the optimal routes and connects infrastructure owners with network providers to accelerate the expansion of wireline networks that benefit communities.

How we support Wireline Networks

Market your wireline infrastructure

Asset Market's map based platform streamlines the process for **Infrastructure Owners** to market their available capacity to network providers looking to deploy in their geographies. Organizations that own conduit, fibre, and other wireline network infrastructure have an efficient path to market to earn additional revenue by leasing their available capacity.

Improve the time to market

Network Providers can use Asset Market to find available fibre, conduit and other wireline network infrastructure as you extend your network connectivity. Our online platform makes it easier to view what is available, and to build your network leveraging existing infrastructure to reduce costs and improve your time to market.

Optimize your route planning

Asset Market's platform helps **Planners** with decision making for new routes to maximize usage of existing infrastructure while reducing build cost and improving time to market. The platform helps users understand the full picture of market conditions using a combination of your unique information and Asset Market's data analytics.
